IN THE CLAIMS

1. (Currently Amended) A method for compressing the representation of a sequence of points in a space, the method comprising:

dividing a sequence of points into segments of successive points;

determining a compression size for each of the segments, wherein the compression size varies based on information in each segment; and

compressing each of the segments into the compression size for each segment. irrespective of the compression applied to the other segments.

- (Original) The method of claim 1, wherein the step of dividing comprises dividing a sequence of points into segments of S successive points.
- 3. (Original) The method of claim 1, wherein before the step of dividing, the following step is performed:

determining the value of S.

4. (Currently Amended) The method of claim 3, wherein the step of determining the value of S comprises

generating multiple compressions of the sequence, each of the multiple compressions at a different value of S.

5. (Currently Amended) The method of claim 3, wherein the step of determining the value of S comprises

generating a compression of the sequence for each value of S from a minimum to a maximum.

6. (Currently Amended) The method of claim 3, wherein the step of determining the value of S comprises

generating a compression of the sequence for each value of S from a minimum of two (2) to a maximum equal to the number of points in the sequence.

7. (Currently Amended) The method of claim 3, wherein the step of determining the value of S comprises

generating multiple compressions of the sequence, each of the multiple compressions at a different value of S; and

determining the value of S to be the value of S generating the smallest of the multiple compressions.

8. (Currently Amended) The method of claim 1, wherein the step of compression compressing comprises

compressing each of the segments of S successive, i-bit points into segments of j-bit points, where j<=i.

- 9. (Original) The method of claim 8, wherein the value of j may vary from segment to segment.
- 10. (Original) The method of claim 8, wherein, for any given segment, j is the minimum number of bits necessary to represent the data in that given segment.
- 11. (Original) The method of claim 1, wherein the step of compressing comprises determining the largest coordinate in any dimension of any point in a segment; setting j for the segment to the ceiling of the base-2 log of that largest coordinate; and truncating from points of the segment most significant bits exceeding j bits.
- 12. (Currently Amended) The method of claim 1, wherein the sequence of points in is an electronic signature.

segment;

- 13. (Original) The method of claim 1, wherein the step of compressing comprises compressing each of the segments without losing any of the data in any of the segments.
- 14. (Original) The method of claim 1, wherein the step of compressing comprises compressing each of the segments, losing data as directed by an invoking user.
- 15. (Original) The method of claim 1, wherein before the step of dividing the following step is performed:

converting DrawTo data to relative-movement data.

16. (Original) A method for compressing an electronic signature, the method comprising: dividing an electronic signature comprising a sequence of i-bit points into segments of successive points numbering S;

compressing each of the segments into segments of j-bit points without losing any of the data in the signature by

determining the largest coordinate in any dimension of any point in a

setting j for the segment to the ceiling of the base-2 log of that largest coordinate; and

truncating from points of the segment most significant bits exceeding j bits.

17. (Original) The method of claim 16, wherein before the step of dividing, the following steps are performed:

converting DrawTo data to relative-movement data;

generating multiple compressions of the sequence, each of the multiple compressions at a different value of S; and

determining the value of S to be the value of S generating the smallest of the

multiple compressions.

18. (Currently Amended) A data store wherein is located a computer program for compressing the representation of a sequence of points in a space by:

dividing a sequence of points into segments of successive points;

determining a compression size for each of the segments, wherein the compression size varies based on information in each segment; and

compressing each of the segments <u>into the compression size for each segment</u> irrespective of the compression applied to the other segments.

19. (Original) A data store wherein is located a computer program for compressing an electronic signature by:

dividing an electronic signature comprising a sequence of i-bit points into segments of successive points numbering S;

compressing each of the segments into segments of j-bit points without losing any of the data in the signature by

determining the largest coordinate in any dimension of any points in a segments;

setting j for the segment to the ceiling of the base-2 \log of that largest

coordinate; and

truncating from points of the segment most significant bits exceeding i

bits.

20. (Original) The data store of claim 19, wherein the computer program compresses an electronic signature by, before the step of dividing:

converting DrawTo data to relative-movement data;

generating multiple compressions of the sequence, each of the multiple compressions at a different value of S; and

determining the value of S to be the value of S generating the smallest of the

multiple compressions.

21. (Currently Amended) A compressor for compressing the representation of a sequence of points in a space, comprising:

the data store of claim 18;

a data store wherein is located a computer program for compressing the representation of the sequence of points in the space by:

dividing the sequence of points into segments of successive points;

determining a compression size for each of the segments, wherein the

compression size varies based on information in each segment;

compressing each of the segments into the compression size for each segment;

a CPU for executing the computer program in the data store; and a link, communicatively coupling the data store and the CPU.

22. (Currently Amended) A compressor for compressing an electronic signature, comprising: the data store of claim 19;

a data store wherein is located a computer program for compressing an electronic signature by:

dividing an electronic signature comprising a sequence of i-bit points into segments of successive points numbering S;

compressing each of the segments into segments of j-bit points without losing any of the data in the signature by

determining the largest coordinate in any dimension of any point in

a segment;

setting i for the segment to the ceiling of the base-2 log of that

largest coordinate; and

truncating from points of the segment most significant bits

exceeding j bits:

a CPU for executing the computer program in the data store; and a link, communicatively coupling the data store and the CPU.
